URL Filter

An URL filter excludes certain URL types from execution.

URLs can be filtered out based on a number of criteria, which can be used together or separately as needed:

Filer	Description	Comment
Binary Data	Non-ASCII content data with a `200 (ok)` status code.	This will strip away all images and other kinds of binary data.
CSS, JS (HTML Only)	Text/ASCII data not in HTML format with a `200 (ok)` status code.	This will strip away CSS and JavaScript files.
Cached Data (304)	Browser-side cached URLs received with a `304 (found)` status code.	Recommended.
Errors	All errors status code 400 and above, and all URLs with an incomplete response.	If not enabled, a reported error will count as a successful connection.
Host	Hostname exclusion/inclusion filtering.	

Hostname Exclusion/Inclusion

Host filtering can be used to exclude and/or include traffic from particular hostnames.

The filter can consist of a list of hostnames, separated by comma.

You can also explicitly exclude hosts by adding `!` before the hostname.

Examples

```
www.example.com,media.example.com
```

All traffic *not* from `www.example.com` or `media.example.com` will be excluded.

```
!media.example.com
```

Traffic from `media.example.com` will be excluded.
